## DETAILED ACTION

### *Response to Amendment*

1. The Examiner acknowledges the amended claims filed on August 30, 2007.

**Claims 1, 2, 7, 9, 10, 14 and 17** have been amended. **Claim 16** has been canceled.

### *Allowable Subject Matter*

2. **Claims 1-15 and 17-44** (Renumbered as 1-43) are allowed.
3. The following is a statement of reasons for the indication of allowable subject matter:

**Regarding claim 1**, the main reason for indication of allowable subject matter is because the prior art fails to teach or reasonably suggest, including all the element of the present claim, that each of said plurality of image processors performs image processing on the first image signal where each image processor performs a different type of processing from every other image processor, the type of processing being selected from a group consisting of a change of brightness, a change of gradation change characteristics, a correction of a color temperature, a change of saturation, a change of a contour, and a change of a black level of the first image signal stored in said first memory.

**Regarding claim 7** (Renumbered as 13), the main reason for indication of allowable subject matter is because the prior art fails to teach or reasonably suggest, including all the element of the present claim, that each of said plurality of image

processors performs image processing on the first image signal where each image processor performs a different type of processing from every other image processor, the type of processing being selected from a group consisting of a change of brightness, a change of gradation change characteristics, a correction of a color temperature, a change of saturation, a change of a contour, and a change of a black level of the first image signal stored in said first memory.

**Regarding claim 9** (Renumbered as 21), the main reason for indication of allowable subject matter is because the prior art fails to teach or reasonably suggest, including all the element of the present claim, performing a plurality of image processing on the stored first image signal, each of said plurality of image processing is performed according to parameters of image processing different from each other to produce the plurality of second image signals, wherein the parameters of image processing are selected from a group including gain, gradation control, luminance- chrominance, edge enhancement, and saturation emphasis.

**Regarding claim 10** (Renumbered as 26), the main reason for indication of allowable subject matter is because the prior art fails to teach or reasonably suggest, including all the element of the present claim, that the plurality of image processors including types and parameters of the image processing such that at least one of the types and parameters of the image processing are different between said plurality of image processors, the types of image processing including at least one selected from a group consisting of a change of brightness, a change of gradation change characteristics, a correction of a color temperature, a change of saturation, a change of

a contour, and a change of a black level of the first image signal stored in said first memory.

**Regarding claim 14** (Renumbered as 32), the main reason for indication of allowable subject matter is because the prior art fails to teach or reasonably suggest, including all the element of the present claim, performing a plurality of image processing on the first image data, each of said plurality of image processing is performed according to parameters of image processing different from each other to produce the plurality of second image data; wherein a combination of imaging parameters and values applied to generate each second image data is unique for each second image data among the plurality of second image data, the parameters of image processing selected from a group including gain, gradation control, luminance-chrominance, edge enhancement, and saturation emphasis.
